RESEARCH INTERESTS

My research interests lie in the intersection of *information theory*, *signal processing* and *machine learning*. I have recently leveraged tools from information theory and signal processing to develop *theoretically justified* learning algorithms for diverse applications, including model compression, anomaly detection, and fair/trustworthy machine learning. More broadly, the primary goal of my research is to lay information-theoretic foundations for the learning algorithms with limited labeled data, including transfer learning and federated learning, particularly with privacy, fairness, and communication constraints.
